

Question 1 continued

(Total 4 marks)

Q1

Figure 1

(a) Show that the distance of the centre of mass of the solid from O is

$$\frac{(k^2 - 3)r}{4(k + 2)} \quad (5)$$

The point A lies on the circumference of the base of the cone. The solid is suspended by a string attached at A and hangs freely in equilibrium. The angle between AO and the vertical is θ , where $\tan \theta = \frac{11}{14}$

(b) Find the value of k . (4)

Q2

(Total 9 marks)

(b) Find the value of x when $t = 5$ (5)

Q3

A particle P of mass m is attached to one end of a light elastic string, of natural length $2a$ and modulus of elasticity $6mg$. The other end of the string is attached to a fixed point A . The particle moves with constant speed v in a horizontal circle with centre O , where O is vertically below A and $OA = 2a$, as shown in Figure 2.

- (a) Show that the extension in the string is $\frac{2}{5}a$. (6)
- (b) Find v^2 in terms of a and g . (5)

(Total 11 marks)

Q4

- (a) Show that the period of the motion is $\frac{6}{5}$ s. (5)
- (b) Find the distance of P from B when $t = 2$ s. (3)
- (c) Find the maximum magnitude of the acceleration of P . (2)
- (d) Find the maximum speed of P . (2)

Q5

6.

Figure 3

A smooth hollow cylinder of internal radius a is fixed with its axis horizontal. A particle P moves on the inner surface of the cylinder in a vertical circle with radius a and centre O , where O lies on the axis of the cylinder. The particle is projected vertically downwards with speed u from point A on the circle, where OA is horizontal. The particle first loses contact with the cylinder at the point B , where $\angle AOB = 150^\circ$, as shown in Figure 3. Given that air resistance can be ignored,

(a) show that the speed of P at B is $\sqrt{\left(\frac{ag}{2}\right)}$, (3)

(b) find u in terms of a and g . (4)

After losing contact with the cylinder, P crosses the diameter through A at the point D . At D the velocity of P makes an angle θ° with the horizontal.

(c) Find the value of θ . (7)
